## Soil Environmental Chemistry Program

### Research program

- ❖ **Soil/Environmental contaminant chemistry; ecotoxicology emphasis on environmental media (air, soil, dust, water, food) exposure and human and ecological risk assessment**
- ❖ **Development and evaluation of soil remediation technologies**
- ❖ **Beneficial use of organic residuals including biosolids**

### Personnel :

**full time staff – Research Assoc. /Laboratory Manager; 2 Research Assoc.; Research Scientist; Research Assistant**  
**5 graduate students and 4 part-time laboratory assistants**

**64,429 students (3<sup>rd</sup> largest in the US) including**  
**53,829 undergraduate students in 170 majors**  
**10,600 graduate students in 258 MS /PhD degree programs**  
**5,500 international students from 115 countries**

**4,000 faculty**  
**1,600 visiting international scholars**  
**32,000 employees**  
**\$5B/yr budget**

# Revitalization of Degraded Urban Soils

Many urban soils and brownfields have lost their soil quality. These soils have lost their essential “ecosystem services, to support vegetation, support the food chain (earthworms for birds, etc), and recycle waste materials (dead vegetation, excess nutrients).

**Degraded soils in Calumet, IL**

# High Quality Soil is the Foundation of a Healthy Ecosystem

**Soil Quality: The capacity of a soil to function to sustain plant and animal productivity, maintain or enhance water and air quality, and support human health and habitation.**

# High Demand for High Quality Soil

**Topsoil Excavation from Farmland  
“borrowed soil”  
destruction of vital Natural Resource  
Lower quality subsoils being used  
as value of farmland topsoil hits  
record highs**

**Solution: Manufactured Soil Blends  
Compost, Animal Manure,  
Biosolids, and/or other bioproducts**

**Akron Biosolids compost**

monitor air, water, soil quality  
corn/wheat yields**

# Long-Term Ecological and Environmental Benefits from Land Application of Biosolids

## Ohio State University

Plots established by Dr. Terry Logan in 1992  
One time application of biosolids in 1992

Soil Organic C (in 2007) increased from  
12 g/kg to 27 g/kg

# Long-Term Ecological and Environmental Benefits from Land Application of Biosolids

**Percent Mortality**  
**Reproduction (cocoon, juveniles)**  
**Contaminant Bioaccumulation**

**Dry matter**  
**growth**  
**bioaccumulation**  
**germination**

# Summary

- **Biosolids improves soil quality and fertility**
- **Long-term application increases plant biomass**
- **Prevents plant micronutrient deficiency**
- **No negative effect on soil invertebrates (earthworms)**

# The Calumet Region of NE Illinois & NW Indiana

## Characterized by:

- Wetland Remnants
- Migratory Waterfowl Stopover Sites
- Landfill and NPL Sites
- Abandoned Industrial Sites
- Proximity to Population Centers
- Locally Available Municipal Residual Materials
- Targeted for Ecological Restoration

Location of  
Research Plots

# The Guiding Document...

Developed by multiple stakeholders such as...

- Chicago Dept. of the Environment, IL & US EPA, US F&WS.
- Established SITE SPECIFIC Background, Threshold (NOAEL) & Benchmark (LOAEL) levels of contaminants in soil, sediment and surface waters of the region
- Our data was compared against THESE LEVELS

# Project Objective

US FWS had concerns about the use of biosolids as a restoration material in the Calumet area - vegetative compost was proposed instead...but .. compost is not soil

Therefore, this study compares biosolids / blends to vegetative compost performance in **restoring ecological function to degraded sites, while minimizing environmental impact**

Performance of soil treatments were evaluated for:

- Restoration of native vegetative community, soil health, microbial function & ecology, invertebrate reproductive function and population and

Runoff was evaluated for impact of nutrients / contaminants on water quality

**Research Field Location in Calumet, Illinois**

# Experimental Design - Randomized Runoff Plots

## 4 Treatments+ control - 4 Replicates

CS = Control soil      VC = Vegetative compost 2.5 cm/ 1 in  
B1 = Biosolids 2.5cm/ 1 in      B2 = Biosolids 5.1 cm/ 2 in  
CT = Combination treatment of biosolids 2.5 cm/ 1 in  
+ WTR + biochar

# Soil Treatment/Blend Materials

## MWRD Biosolids

## Vegetative Compost

**Water Treatment Residual (WTR) -  
added to bind excess soluble P**

**Biochar – added to absorb  
potential organic contaminants**

# Site Precondition

# Aaron Mali and Oulu Coquie rototill in the Soil Treatments

# Study Site after plot borders installed

# Plot installation and rainfall runoff collection

- Runoff collected for every rainfall event, for 3 yrs and analyzed for TSS, pH, EC, N, P and dissolved metals
- Microconstituents (PPCPs) analyzed by AXYS Analytical Labs

# Soil Sampling

**Plots were seeded with 33 native grass, legume and forb species from Cardno JFNew**

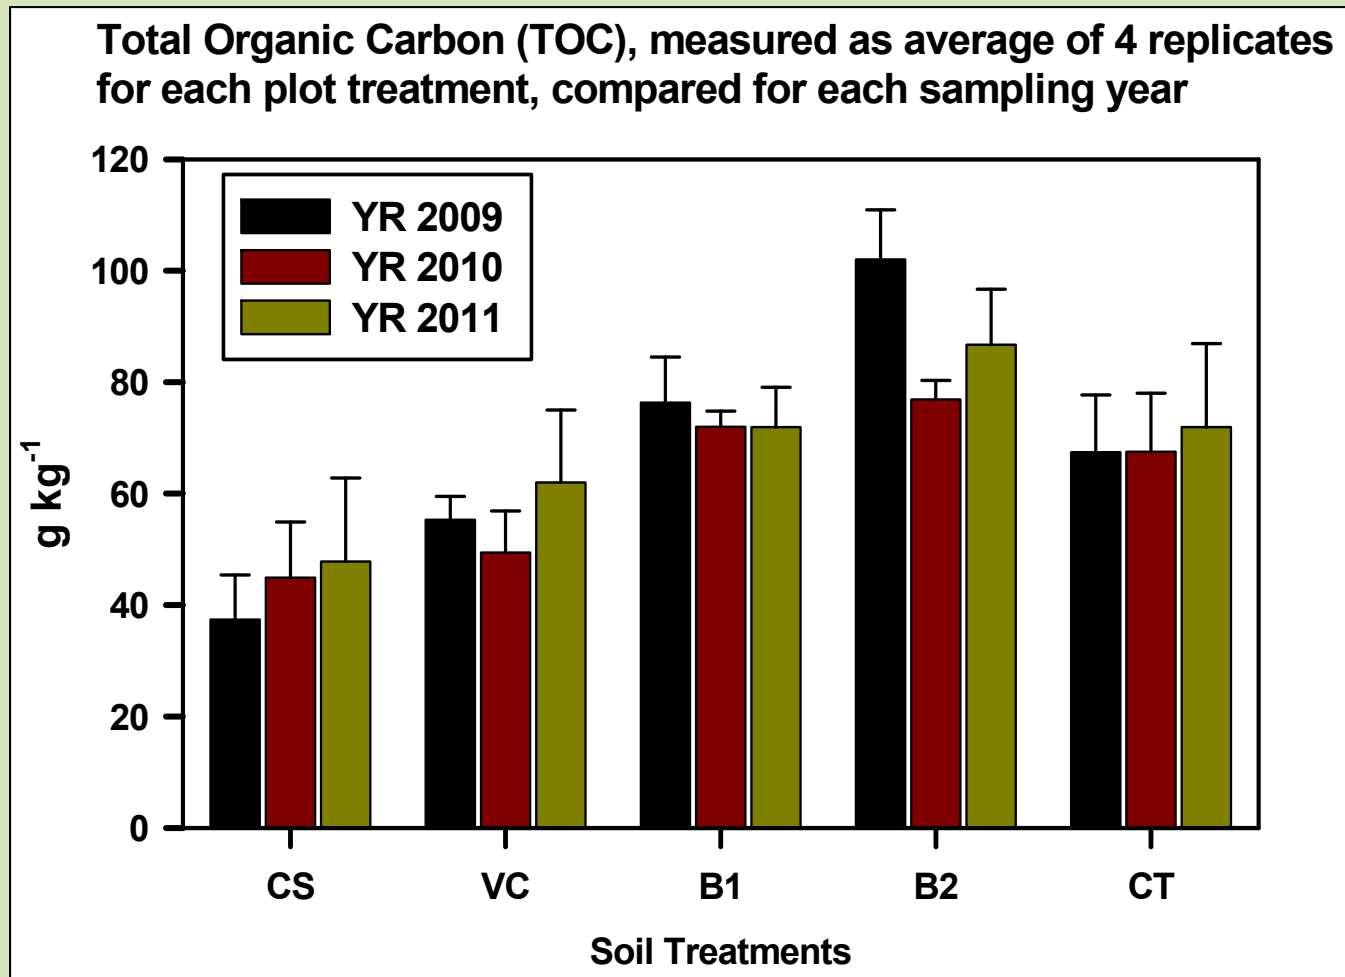

**• Vegetation sampled yrs 2 & 3 and plant tissue was analyzed**

- Soils sampled annually and analyzed for multiple constituents**
- Laboratory earthworm bioassay conducted to measure mortality and reproductive endpoints**

➤ ***Results....***

# Select soil quality measures

**Biosolids increased soil organic carbon, total N, plant available N (PAN) more than compost treatment**

|                     | Year | Plot soil treatment |        |        |        |        |

# Heavy Metal(loid)s in Soil

BS Treatments increased soil Cu and Zn

these levels are below any concern  
(incl. USEPA EcoSSLs)

addition of Cu and Zn and other  
micronutrients are beneficial because  
these are essential plant nutrients

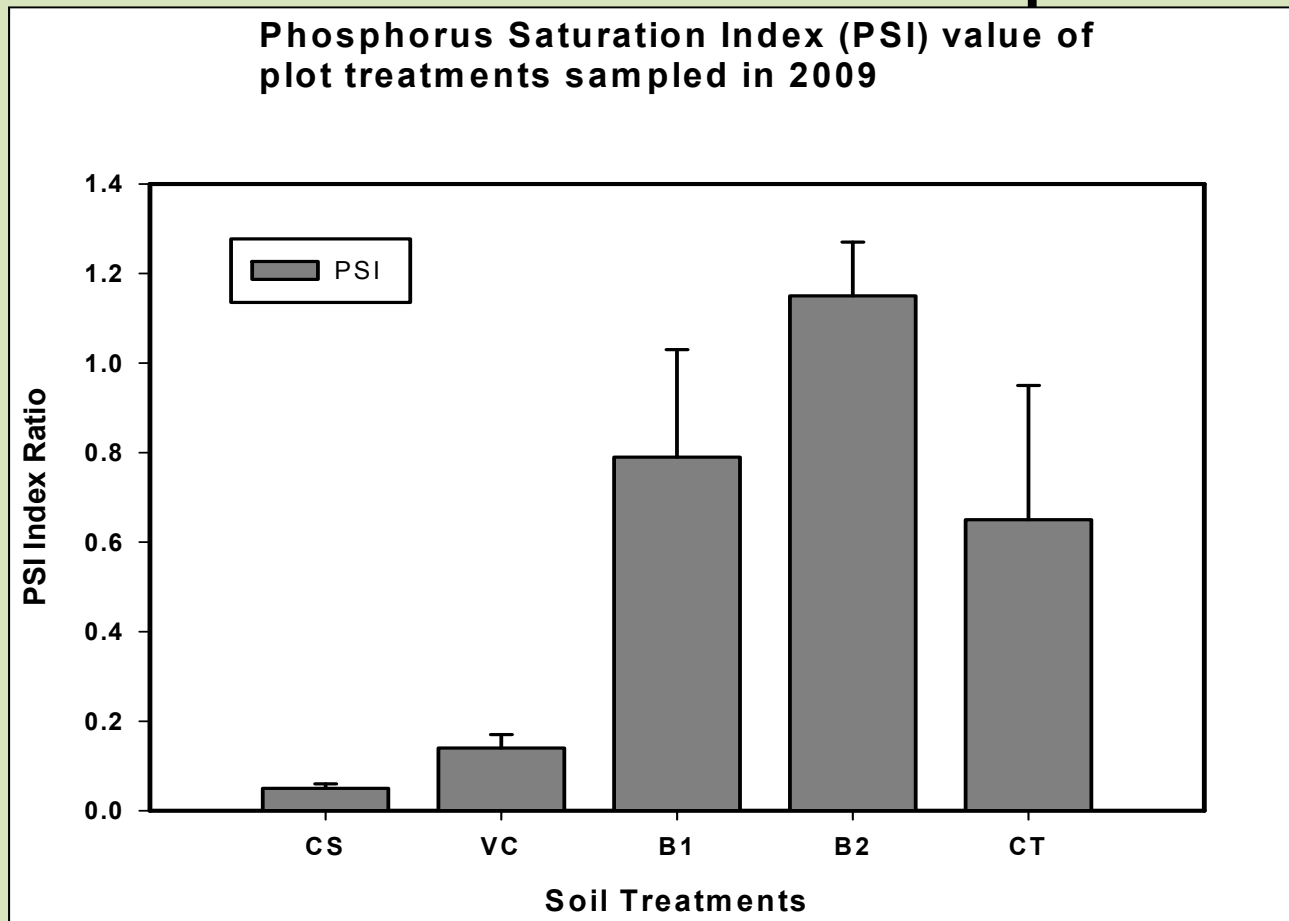

animals manure or biosolids provides  
micronutrients –compost doesn't

†Means within parameter measured with same letter are not different

‡ Not analyzed

§ Below detect limit

# Biosolids Increased Soil Phosphorus

**Phosphorus Saturation Index (PSI (%)) =  $[(P_{ox}) / (Al_{ox} + Fe_{ox})] \times 100\%$ ; values over 1 have been correlated with potential transport of labile (soluble) P**

**BS2 a concern; BS1 less concern**

**BS1 is the recommended rate; BS2 included for research purposes**

# Soil Enzymes as an indicator of soil nutrient cycling

| Biological function    | Soil Enzyme                        | Ecosystem service   | Response |    |    |
|------------------------|------------------------------------|---|----------|----|----|
|                        |                                    |   | CS       | VC | BS |
| Chitin degradation     | N-Acetyl- $\beta$ -glucosaminidase | C & N Nutrient cycling; N fixation                                      | -        | +  | ++ |
| Glucose availability   | $\beta$ -glucosidase               | Microbial energy source; indirect heavy metal indicator                 | -        | +  | ++ |
| Inorganic N metabolism | Amidase & urease                   | Supplies N to microbes  | -        | -  | -  |
| P availability         | Acid & alkaline phosphatase        | P release for plant nutrition   | -        | +  | ++ |
| Sulfate metabolism     | Arlylsulfatase                     | Indirect indicator of fungi; potential degradation of microconstituents | -        | -  | +  |
| Broad based nutrient   | Fluorescein diacetate (FDA)        | Overall indicator of healthy soil biological activity                   | -        | -  | +  |

## Select soil enzyme findings

- Biosolids and compost had a positive effect on soil enzymatic activities and microbial function
- Biosolids treatments tended to have higher amounts of fungal biomass compared to control, as well as lower stress biomarkers
- Arylsulfatase (indirect indicator of fungi), N-Acetyl-  $\beta$ -glucosaminidase (C&N nutrient cycling),  $\beta$ -glucosidase (microbial energy,) Phosphatase (P cycling), were increased by both biosolids and compost
- Fluorescein diacetate (FDA) hydrolysis – proxy indicator of fungal and bacterial biomass, thus microbiological activity, increased by biosolids but not compost treatments

# Vegetative Performance and Quality

- Plant biomass increased compared to controls – EXPECTED with application of nutrient rich amendments!
- Biosolids produced highest plant tissue N, thus improved protein content (nutrient) levels
- Biosolids DID NOT elevate trace metals in plants therefore no concern for ecosystem food chain transfer

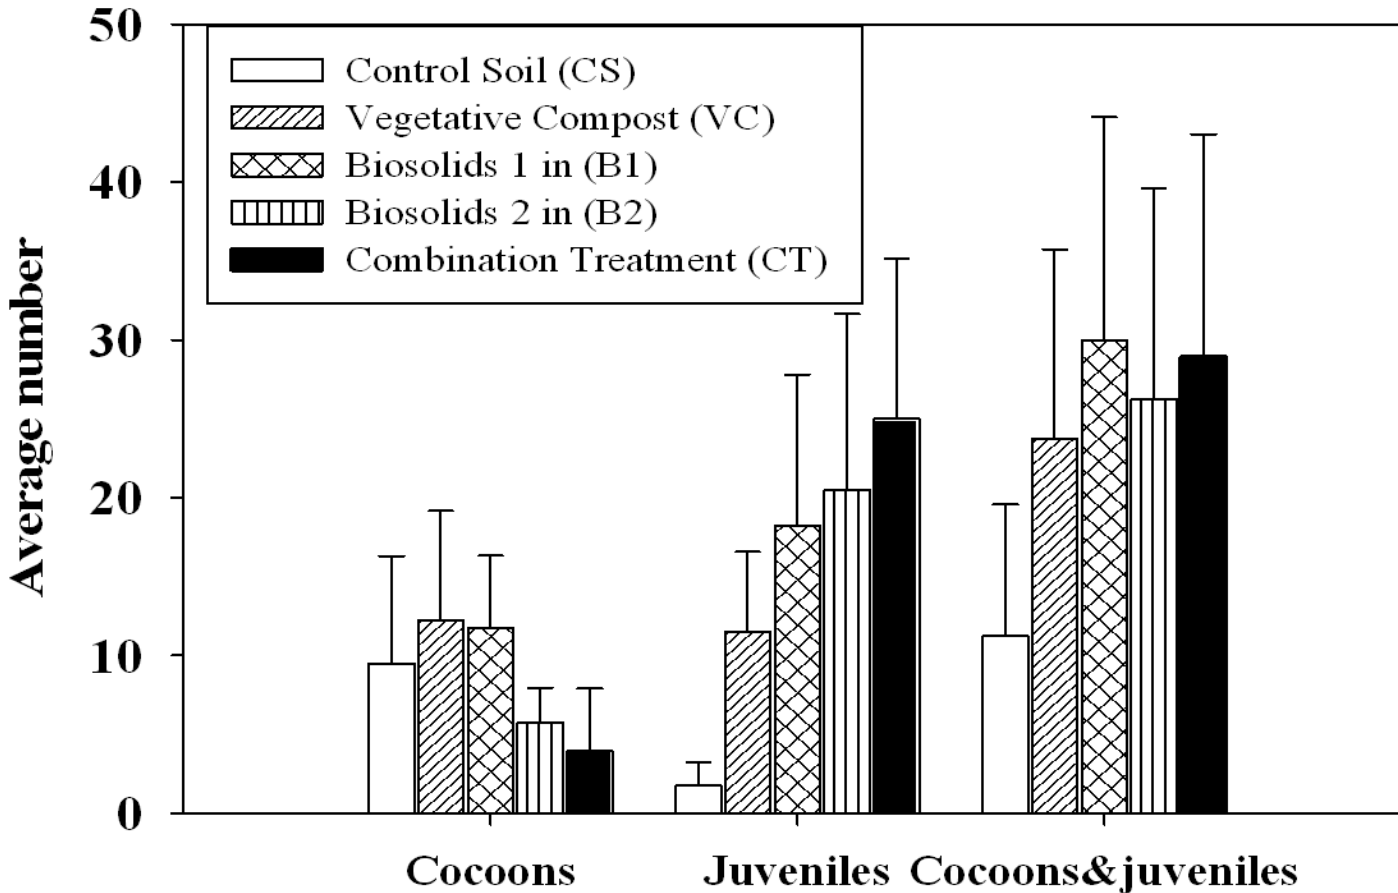

- Both biosolids and VC improved plant diversity
- Biosolids promotes diversity for restoration degraded soil

## Shannon-Weaver Values

■ Grasses SW   ■ Forbs SW

# Earthworm 56 Day reproductive bioassay

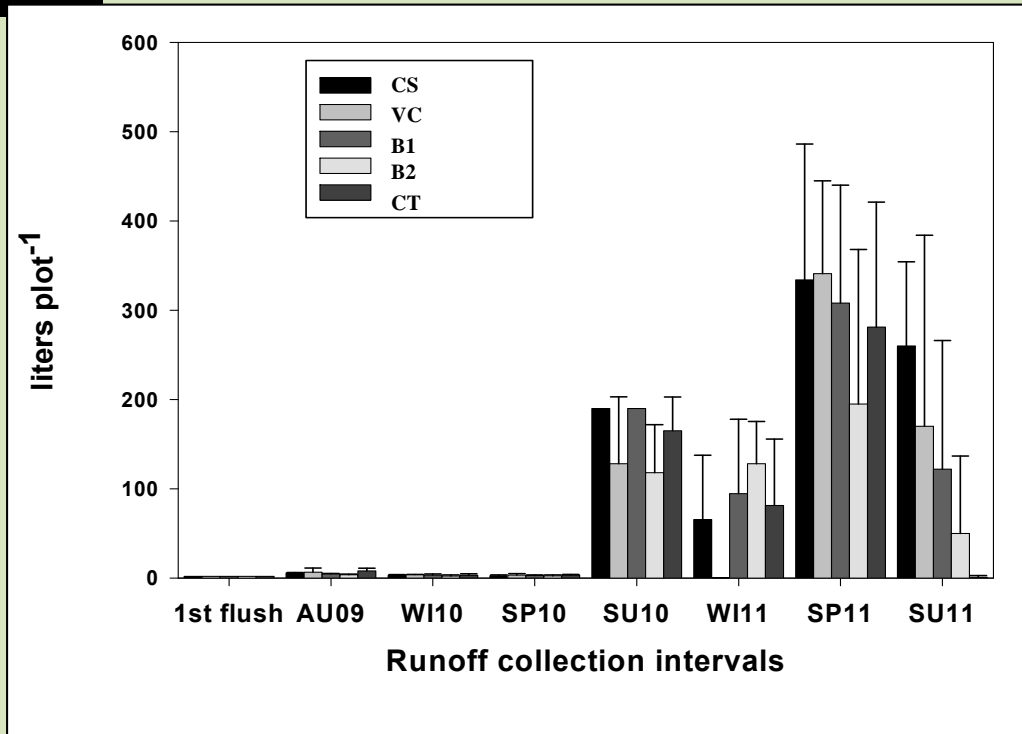

- Neither biosolids or compost had any effect on earthworm mortality
- Both biosolids and compost treatments **increased** number of juveniles and earthworm reproductive success

# Rainfall Runoff Water Quality

CHICAGO ANNUAL PRECIPITATION (IN.)  
1871-2012  
Base: 34.40" (1871-2012 Mean)

**2010: 37.5 inches**  
**2011: 49.5 inches!**

## Select runoff water measures...

**The 1<sup>st</sup> flush of runoff water (1<sup>st</sup> rainfall event) was tested for 14 dissolved metals:**

- **As, Ba, Be, Cd, Cr, Cu, Fe, Mn, Mo, Ni, Pb, Sb, Se & Zn**

### **Findings:**

- **All metals below Calumet Ecotoxicology Protocols (LOAEL) except Cu 2” Biosolids treatment we are not recommending BS2. No concern with BS1**

# Concentration of soluble total N in filtered runoff water sampled after 1<sup>st</sup> flush, and seasonally thereafter

**Greater loss of soluble N associated with biosolids declined markedly to near background levels within 1 year**  
**Use best management practices to control sediment/runoff loss**

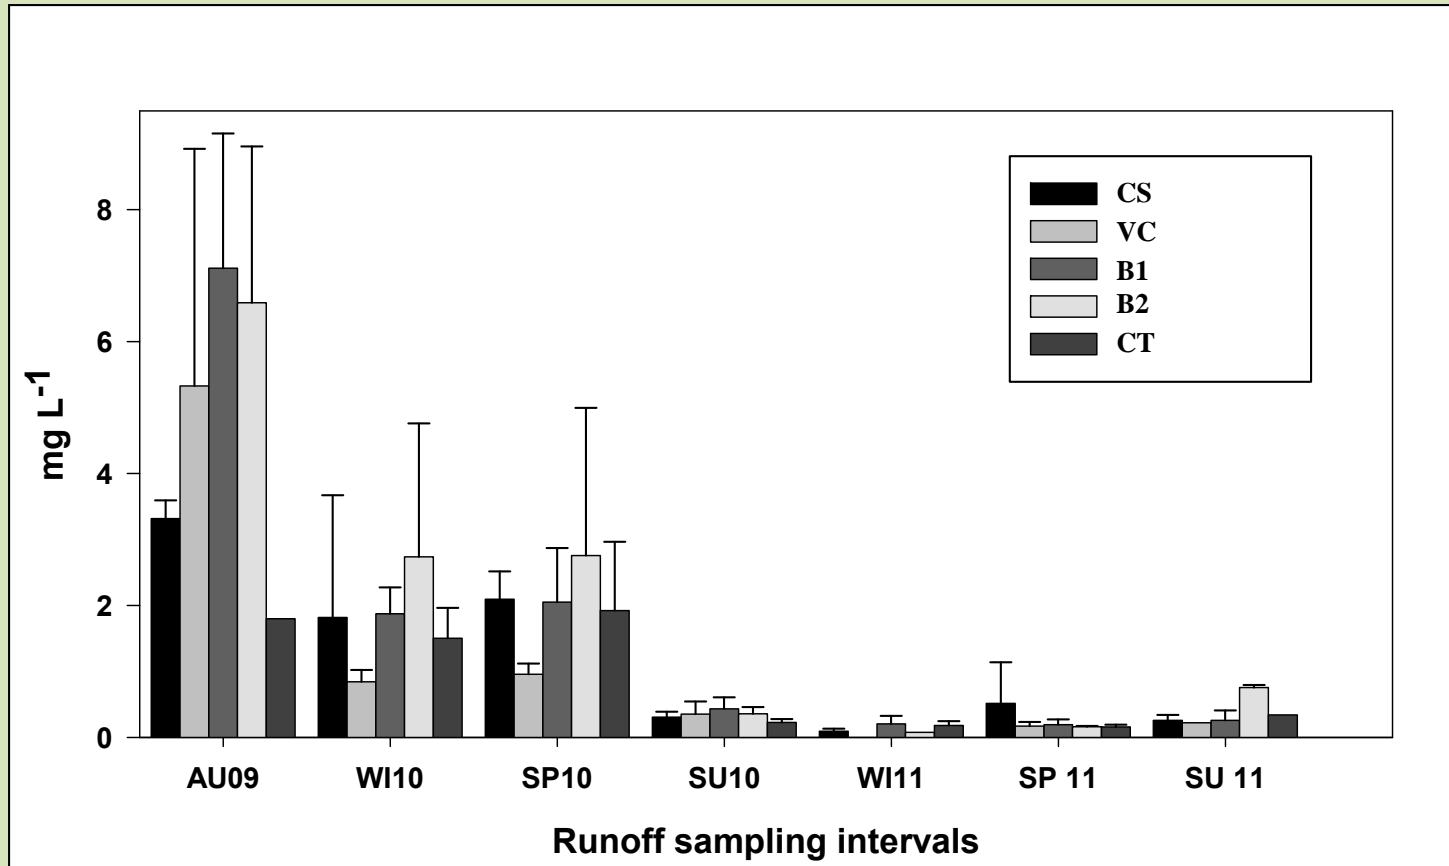

# Concentration of soluble P in filtered runoff water sampled after 1<sup>st</sup> flush, and seasonally thereafter

- Biosolids increased runoff P compared to compost
- Soluble P loss from biosolids treated plots was sustained over time
- Application of additional WTR in 2nd year (after SU 10 sampling) was starting to have an impact on P levels

# Total Suspended Solids

**TSS high before the site was stabilized (i.e. vegetation)  
Better erosion control practices needed to reduce TSS  
after establishment**

**Emerging Contaminants  
Microconstituents  
Pharmaceuticals and Personal Care Products**

- **119 PPCP were tested by Axys Analytical Labs**
- **20 compounds were measured above detection limits, concentrations ranged from approx 1 to 1760 ng L<sup>-1</sup> (Ibuprofen)**
- **4 compounds detected in runoff from all treatments**
- **No concentrations were above NOAEL (daphnia) and were below probable no-effect levels in literature (PNEC)**

# Top 5 compounds, which were 10 times greater than detection limit

| Compound                 | CS                 | VC                 | B2                | CT                | NOAEL          |

# Conclusions

- Biosolids increased soil organic carbon and many soil quality measures more than compost
- Vegetative performance and community measures responded favorably to both compost and biosolids applications - biosolids response was more pronounced
- Microbial response to compost and biosolids applications were similar - biosolids enhanced fungal population measures
- Terrestrial receptors (earthworms) reproductive measures were increased by compost and biosolids
- The biosolids applied at the 5.1 cm / 2 in rate exhibited potential for P runoff
- The WTR combined with biosolids showed some effect in reducing P runoff
- PPCP levels in runoff were below LOAELs in the literature

# Technology Transfer Millennium Reserve

## **Environment**

- Manage core natural lands that contain important high-quality biological communities and support rare plants and animals.
- Expand and improve healthy natural habitats to maximize biodiversity
- Build a green infrastructure based on a vision shared by the Chicago Wilderness.....

## **Economy**

- Provide training and internships for green jobs including restoration and land management
- Support development of local small businesses
- Restoration will improve property values of the region

# High Quality Soil is the Foundation of a Healthy Ecosystem

- **Topsoil Excavation from Farmland or other “borrowed soil” destroys a vital Natural Resource**
- **Large areas in Calumet Region either has little (fill) or degraded soil**
- **Manufactured Soil Blends and/or soil amendments are essential to large scale restoration/revitalization**
- **Compost alone will not restore severely degraded areas**
- **Local resources are needed to make successful soil blends /amendments**
- **Biosolids from Calumet, USCC compost, WTR from local drinking water treatment plants**
- **Partnerships between MWRD and OSU and others will improve success of Millennium Reserve projects.**
