ANNUAL DATA FOR MONITORING WELLS

Introduction

This system consists of two subsystems, Upper Des Plaines (UDP) 20 and UDP 21. The UDP 20 contains six monitoring wells, MW-1 through MW-6, while UDP 21 contains three monitoring wells, MW-7 through MW-9 (Figure 1). These nine monitoring wells are all sampled six times per year (Illinois Environmental Protection Agency memorandum dated July 9, 2004). Groundwater elevations in the monitoring wells were measured during each sampling event. In addition, groundwater elevations were measured biweekly since these wells also function as observation wells.

During the year, all monitoring wells in the UDP Tunnel system were sampled at the required frequency. Monitoring Wells MW-2, -5, and -7 were all repaired during 2014 through 2015. The pumps in these wells were replaced, and all wells yielded samples as required throughout the year. However, at the end of 2016, Well MW-1 was beginning to exhibit slight problems during sampling. We will continue to observe this well and proceed with repairs when needed. Following repairs in 2015, the wells were decontaminated using the standard procedure to eliminate any fecal coliform (FC) bacteria that might have entered the wells during repairs.

Summary of Data for Monitoring Wells

The analytical data for groundwater sampled during 2016 from monitoring Wells MW-1 through MW-9 are presented in Table 1. Physical characteristics, such as elevation, groundwater temperature, and estimated time of recharge for each well between initial drawdown and sampling, are also included. Fecal coliform counts for most wells were non-detectable. There were a few occurrences of fecal coliform detections in several wells, mostly during June and July. During the month of June, an elevated FC count (140 CFU/100 mL) was observed in MW-5. The FC count in the well returned to non-detectable after September.

Table 2 lists the descriptive statistics for the groundwater data of monitoring wells MW-1 through MW-9 for the year 2016. There were no significant changes observed in any analytes that would suggest any potential for groundwater contamination.

Adjusted groundwater elevations in monitoring Wells MW-1 through MW-9 were calculated relative to the Chicago City Datum (CCD) (579.48 ft. above mean sea level) at the intersection of Madison and State Streets (Table 3). The minimum, mean, and maximum values for each well were calculated and plotted to determine fluctuations in groundwater elevations during the year (Figure 2). Fluctuations were mainly evident in Wells MW-1, -5, -8, and -9 during the year.
