

Antecedent Moisture Modeling

I/I Advisory Technical Panel
October 10, 2012

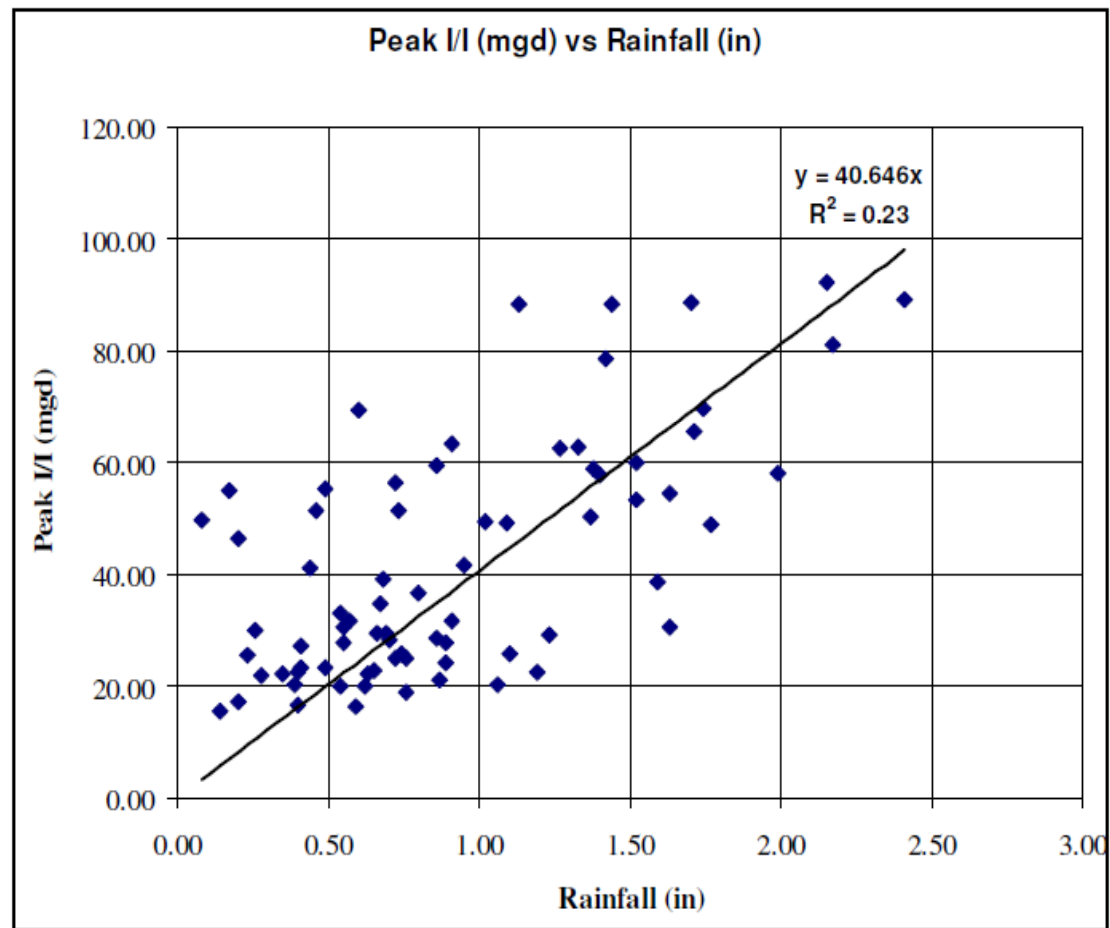

Conventional Approach

Flow vs. Rainfall

Flow vs. Rainfall

Consequences of Uncertainty

- **Inability to quantify I/I**
- **Inability to quantify effectiveness of rehab**
- **Overly conservative improvements**

Nature of the Problem

- **Unknown pathways for I/I to enter sewers**
- **Unknown soil types / permeability**
- **Antecedent moisture**
 - Short and long response times
 - Seasonal response
 - Back-to-back events

Effect of Antecedent Moisture

THERE IS A BETTER WAY!

- **Antecedent Moisture Modeling (AMM)**
- **Long-Term-Simulations (LTS)**

Antecedent Moisture Modeling

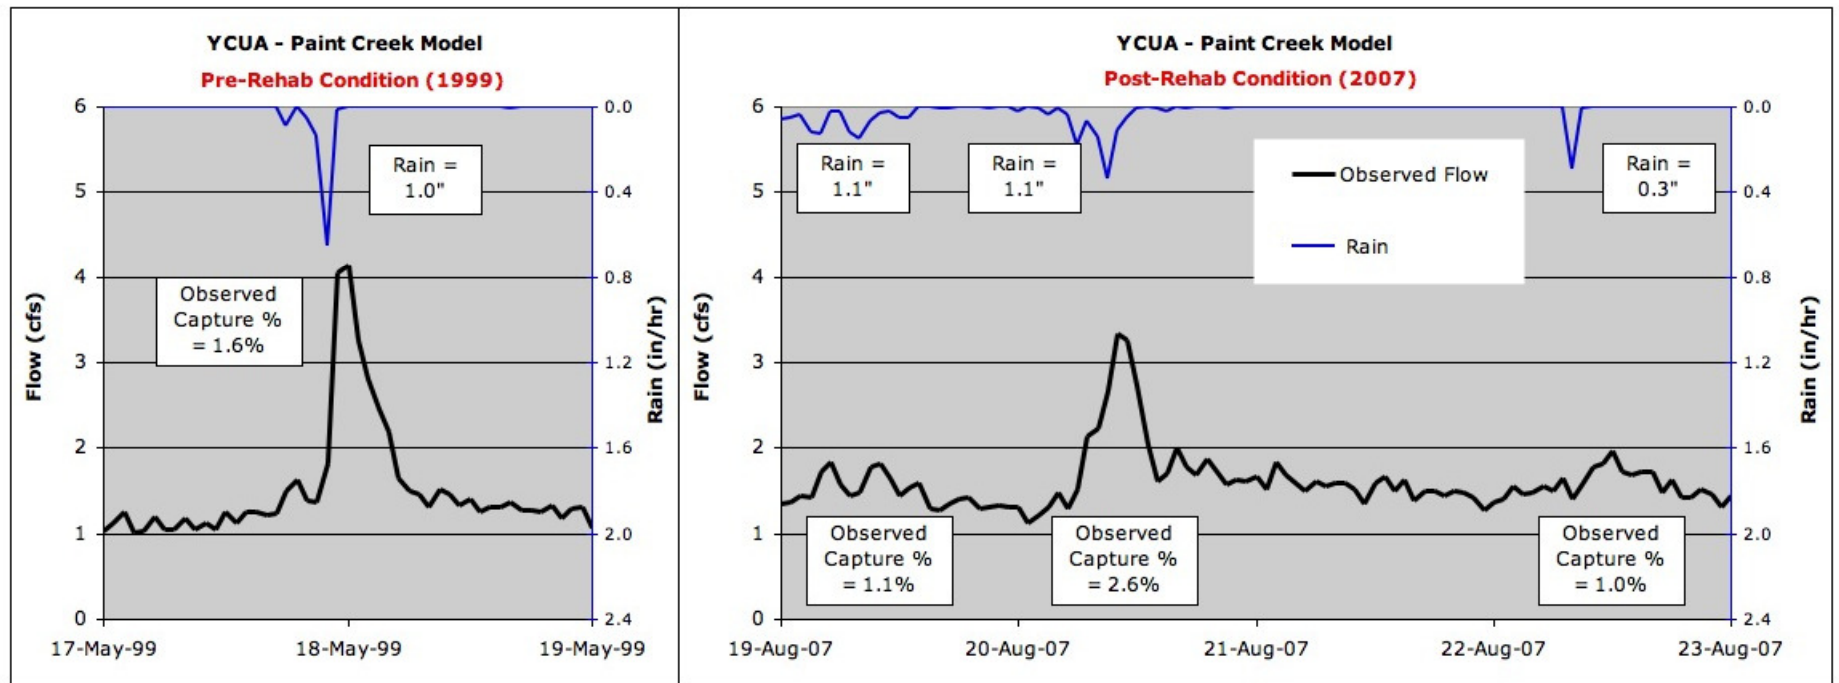

- Rainfall Dependent Infiltration (RDI)
- Simulates hydrologic cycle

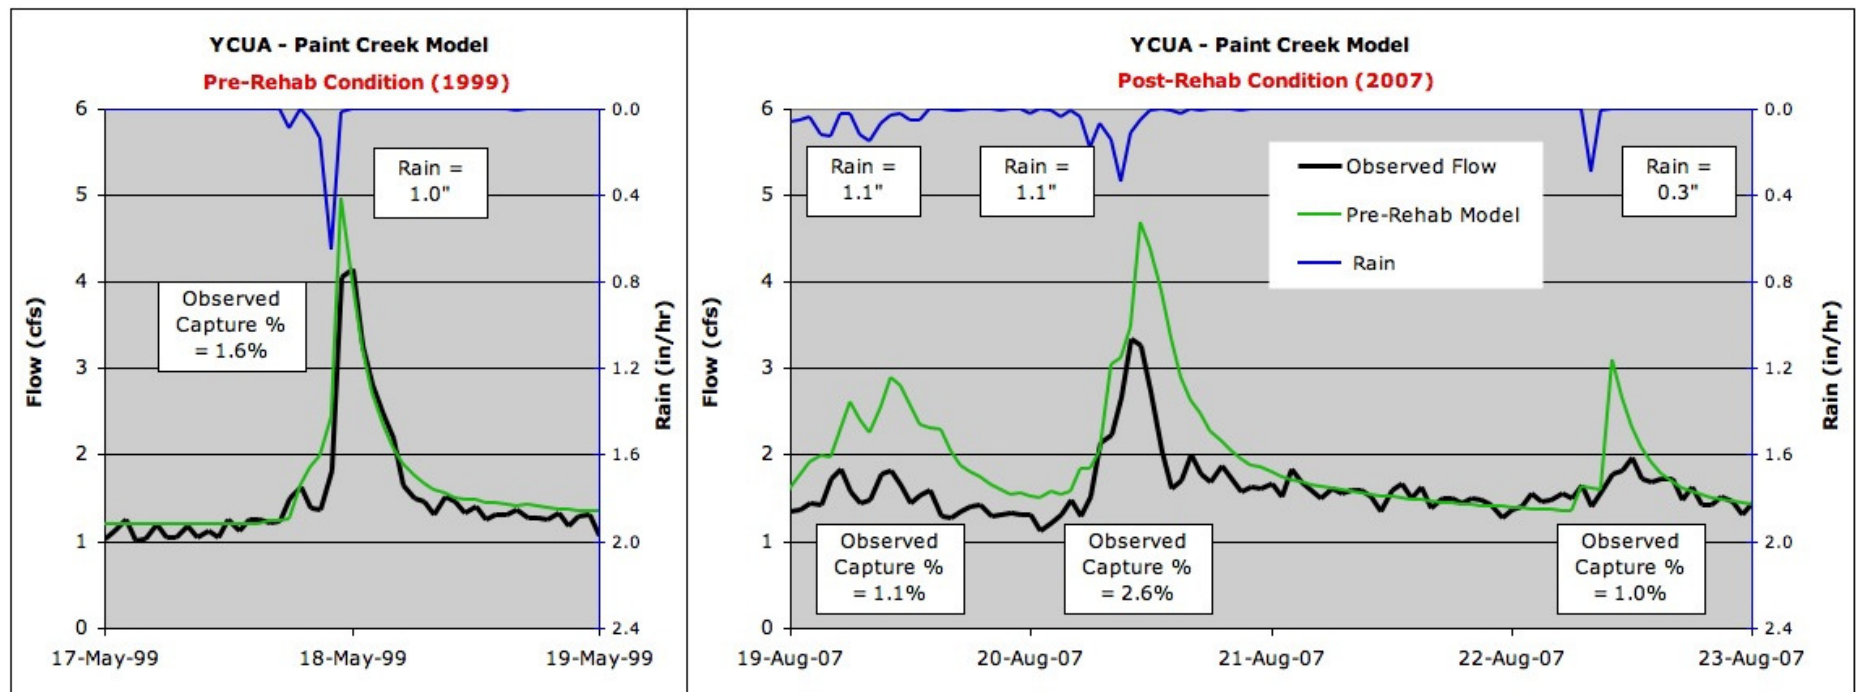

Antecedent Moisture Modeling

- **Rainfall Dependent Infiltration (RDI)**
- **Simulates hydrologic cycle**
- **Predicts short & long-term response**
- **Simulates effect of back-to-back events**
- **Predicts wet weather response over long periods of time**
- **Empirical model** (requires long-term calibration)

Cost-Effective Analysis

Item	Quantity
I/I Reduction Goal	30%
I/I Reduction to Date	13%
Peak Flow Reduction	8 MGD
Public Rehab Costs	\$15M
Private Rehab + Ancillary	~\$15M
Unit Cost	\$2M - \$4M per MGD

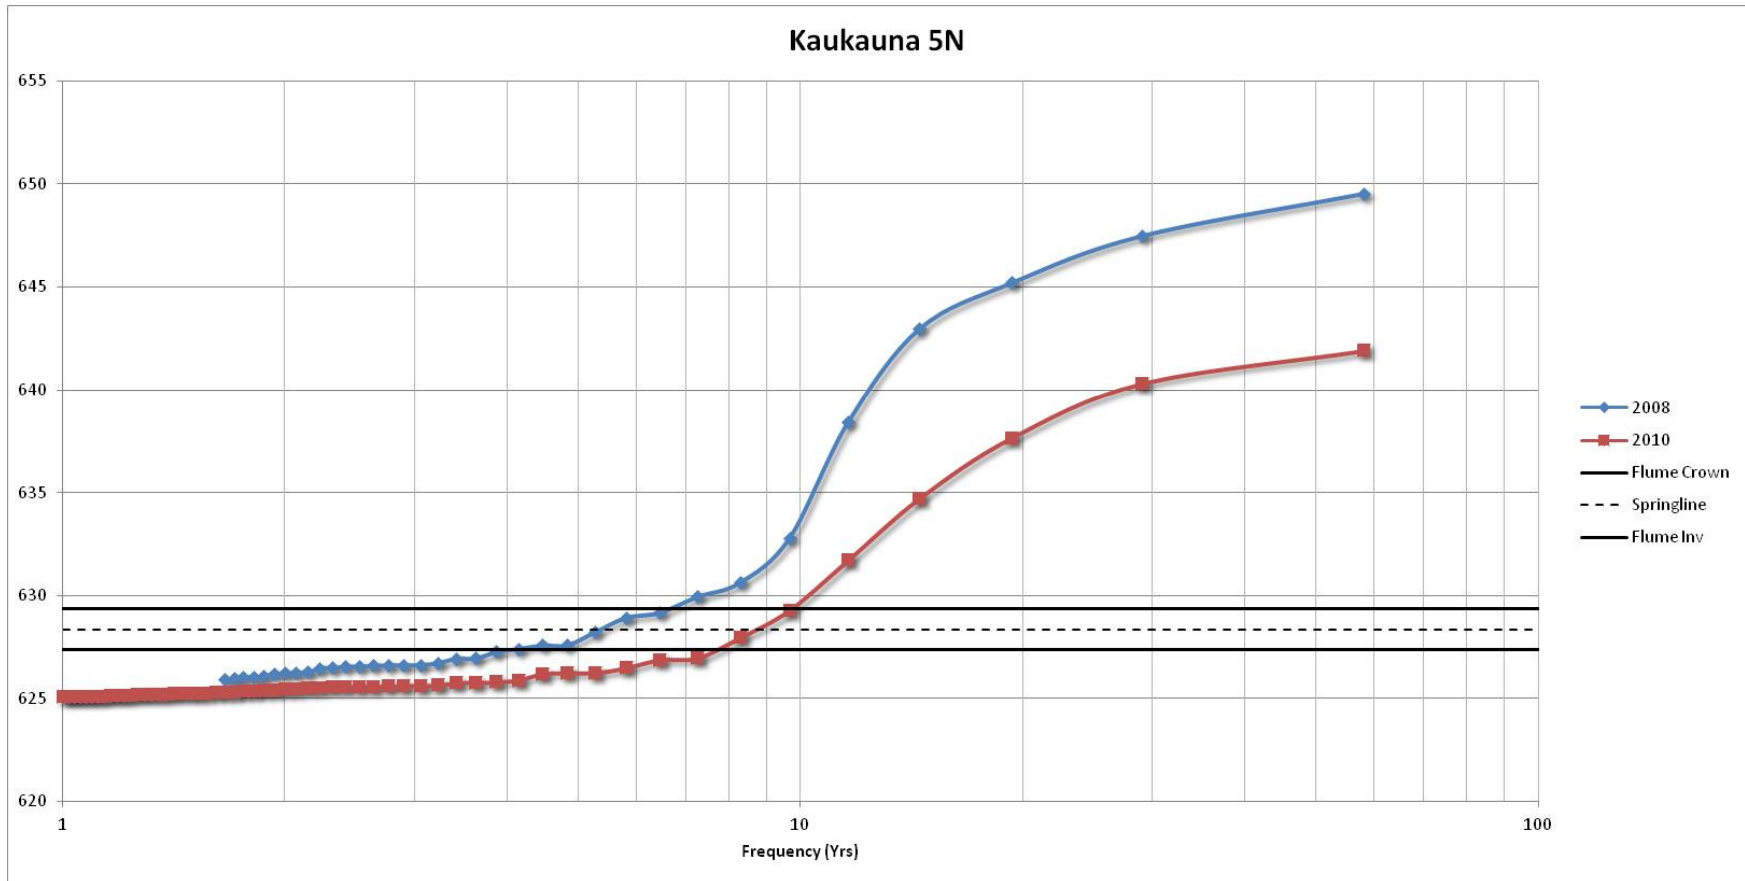

Long Term Simulations (LTS)

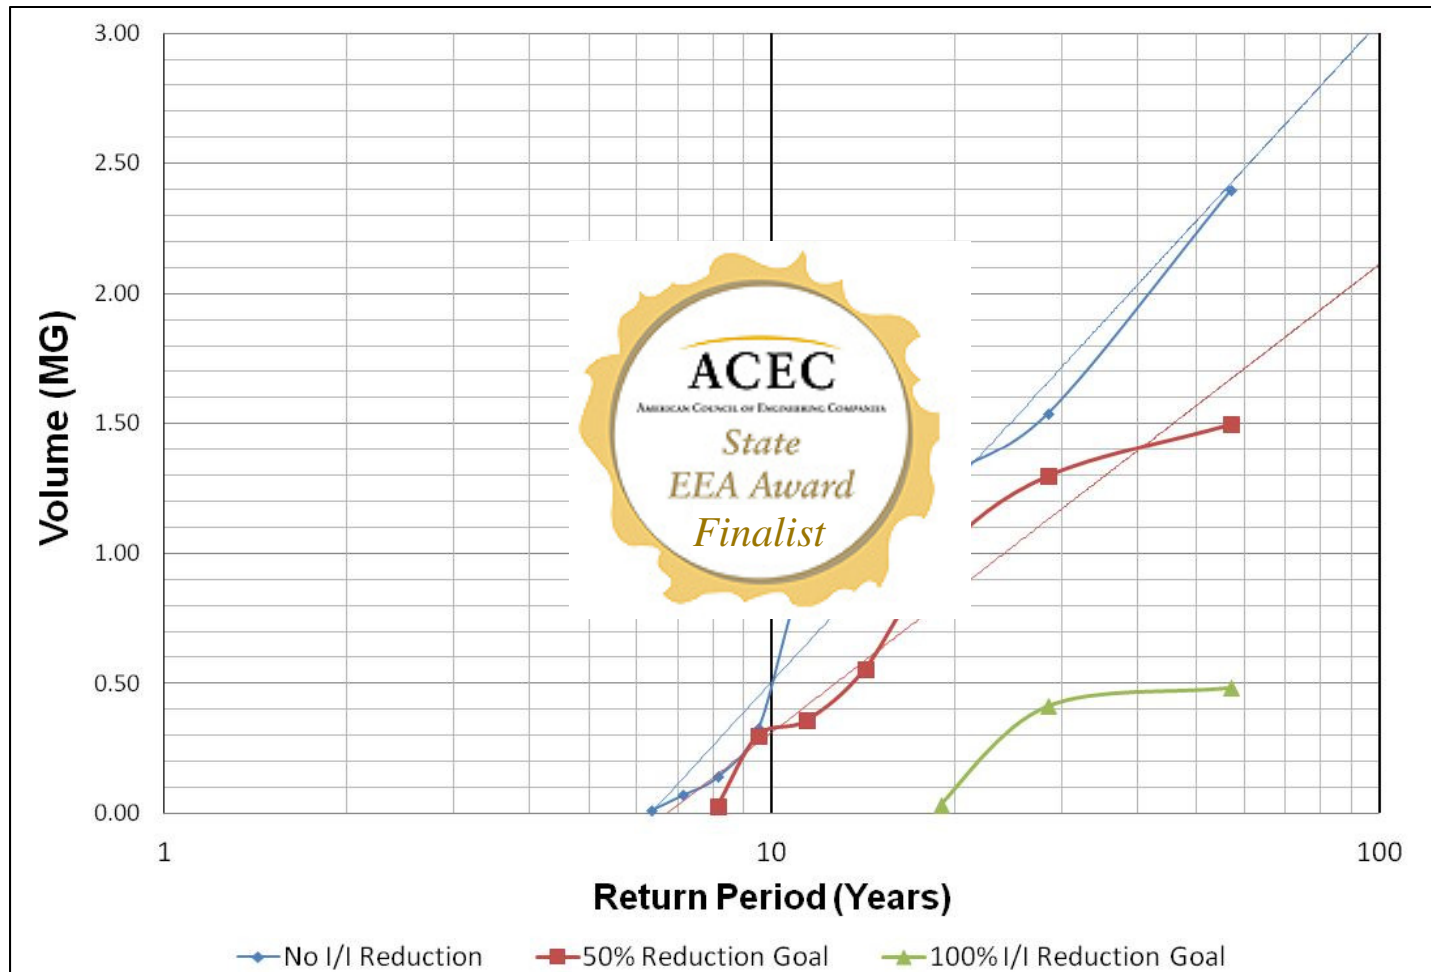

Heart of the Valley

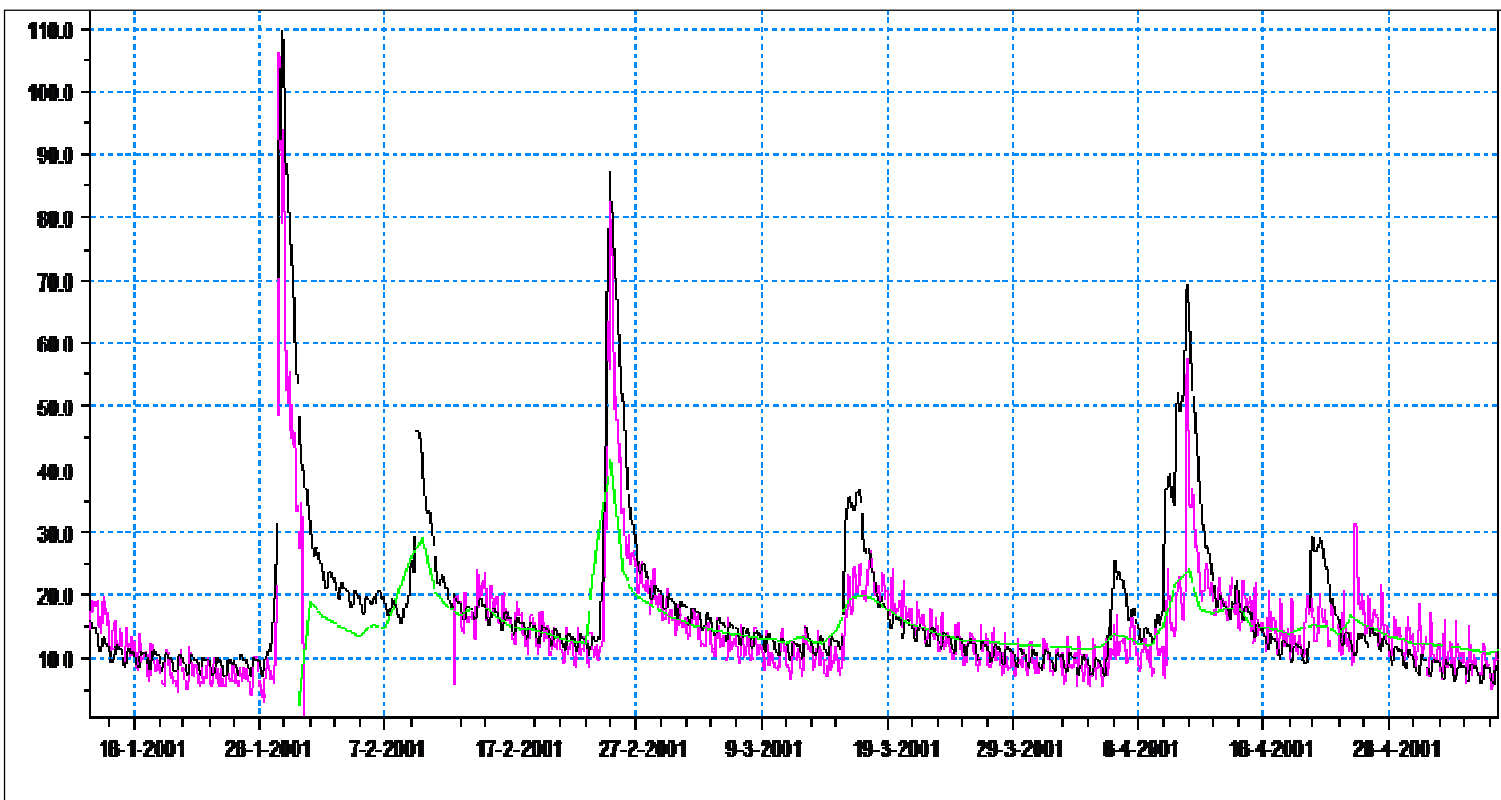

Surcharge Frequency

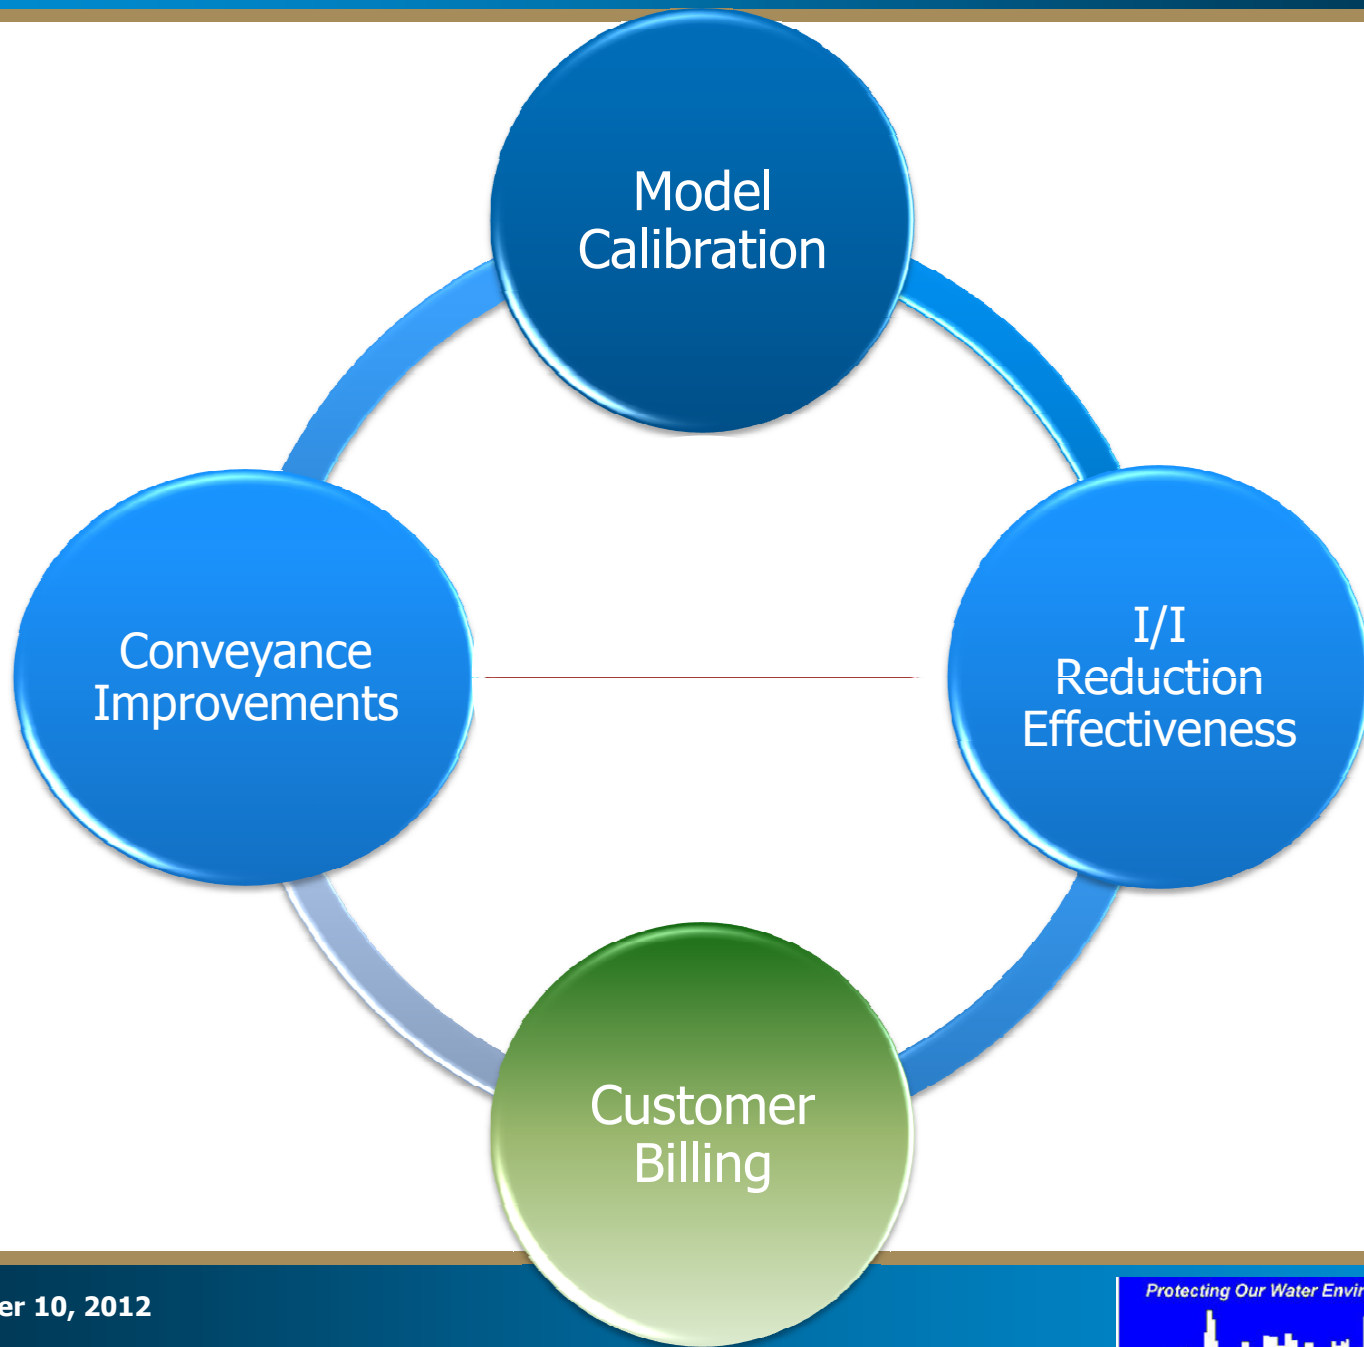

Flow Equalization Sizing

RDI Model Calibration

Modeling Software

Name	Developer	AMM Method	GIS Integration
MikeUrban	DHI	Full RDII	Good
XP-SWMM	XP Software	UH ¹	Poor
EPA SWMM	USEPA / CDM	UH	None
InfoWorks CS	Innovyze	Full RDII	Excellent
Info-SWMM	Innovyze	UH	Excellent
SewerGEMS	Bentley	UH	Excellent
H ₂ O Metrics	i3D Technologies	Variable PR ²	N/A
Hydra	Pizer	None	None
PC-SWMM	CHI	UH	Poor

1. Unit Hydrograph
2. Percentage Runoff
